ABSTRACT

One role for institutional research within the university's budget is to provide objective data and informed judgements to help the responsible decisionmaking of the university organization. This report attempts to fulfill this function in organizational intelligence. In the university, as in all responsibly operated enterprises, projections of incomes and expenditures are necessary. This document contains statistical charts and trend line graphs on estimating enrollment and credit hours for full and part-time students to aid in the decisionmaking at colleges and universities. The author presents an explanation of the use of institutional research in the university budgeting process, including the data and method used in the report. Statistical charts and trend-line graphs are then presented using the University of San Francisco as a basis for the predictions. (Author/PG)

WILLIAM SHAKESPEARE:

What's past is prologue.

---The Tempest, Act II, Scene I

WILLIAM WORDSWORTH:

Books! 'tis a dull and endless strife:
Come, hear the woodland linnet,
How sweet his music! on my life,
There's more of wisdom in it.

And hark! how blithe the throstle sings!
He, too, is no mean preacher:
Come forth into the light of things,
Let Nature be your teacher.

---"The Tables Turned"

P R E F A C E

Though originally designed on a more holistic and less detailed basis in terms of individual schools and colleges, this study was redesigned and enlarged to its present form and size under the direction of the Reverend Edmond J. Smyth, S.J., Acting President of the University. Of him, I am pleased to acknowledge his leadership in this matter, his generosity of spirit, and his genuine tolerance for differences in opinion.

Of the following deans and directors, I am privileged to have learned much and I appreciate deeply their grace and charity in discussing and amending these results toward more meaningful ends: The Reverend John H. Martin, S.J., Dean of the Graduate Division; Dean C. Delos Putz, Jr. of the School of Law; Dr. Lloyd D. Luckmann, Dean of the Colleges of Arts and Sciences; Dr. William J. Regan, Dean of the College of Business of Administration; Sister M. Geraldine McDonnell, S.M., Dean of the School of Nursing; Dr. Edward J. Griffin, Dean of the School of Education; Dr. Anthony E. Seidl, Director of the Summer Session; Mrs. Marilyn Quinn, assistant to the late Reverend Gerald A. Sugrue, S.J., Director of the Evening College; the Reverend Andrew C. Boss, S.J., Director of the Labor-Management School; and Dr. Augustine P. Donoghue, Director of Admissions.

Of my own staff in the Office of Institutional Studies, I am always proud to cite their constructive service and diligence. Of my confrere, Mr. William J. Dillon, I am pleased to acknowledge his aid and competence in making this study possible. Of Mr. John M. O'Rourke, undergraduate research assistant, I am grateful for his aid in certain details. Of Mr. Paul D'Anna, undergraduate computer programmer, I am delighted to note with praise his computer work that made these mathematical and statistical results possible. And of Ms. Diane Pederson, I am delighted to note her warm and generous spirit of good will and good humor as well as her competence and technical proficiency in typing and graphics that made this large manuscript what it is in format today. Indeed I am most privileged and grateful to have such a marvelous group of friends and colleagues. To all, I extend my thanks.

Of course, the responsibility for the factual and interpretational character of this report rests with me as it should.

ESTIMATES IN FUTURES: PROJECTIONS, PLANNING
AND THE UNIVERSITY BUDGET

by

James Steve Counelis⁺

Institutional Research and the University Budgeting Process:

Institutional research is a cybernetic reality-testing process for the university. Institutional research provides the university with organizational intelligence about itself, about the environment in which it is privileged to live, and their intersect. Through wise use of organizational intelligence, university goal-seeking can materialize into goal achievement. Without organizational intelligence, the university loses control of itself, it goes into one crisis after another, which crises lead to organizational dissociation and on to paroxysmal death. And those familiar with the history of American higher education as well as the current scene are well acquainted with the fact that death is no stranger to American institutions of higher learning.

Though not usually understood in these terms, university budgets are academic and other plans for university futures in resource al-

⁺Dr. James Steve Counelis is Director of the Office of Institutional Studies and Associate Professor of Education in the School of Education, The University of San Francisco, San Francisco, California 94117.

locational form. And thus the university budget contains within it estimates of university futures. The plural form of "future" is used to refer to the collective futures of the university community of staff, faculty, and students, and to some expectant role in calendrical time down the pike. But also the investment notion is involved in this use of "futures" wherein the budget is viewed as current payments for future returns in human and real capital.

One role for institutional research within the university's process of budget construction and budget decision-making is to provide objective data, objectifying methods and measures so that reasoned, informed, and prudent judgments can be made by the responsible budget decision-making authorities of the university organization. This report attempts to fulfill this function in organizational intelligence.

In the university as in all responsibly operated enterprises, projections of incomes and expenditures are necessary. In fact these projections are the easiest part of budget-making. But the utility of such projections assumes well-enough developed operational goals. For though objective data are useful information and "concretized" projections are important functions in budget development, the answers to the crucial questions as to what the university is all about steer the budget allocational patterns to those goals implied by the answers. And though one can always say that each budget is a transitional conserving budget, that in itself is a value committed goal, one dedicated for the status quo to be continued into the future. I suppose that when the rates of social change were slower and institutions were smaller and simpler in structure,

the time vector as possessing both transitional and conserving functions appeared reasonable. But in our own day, the vector of time is telescoped; and the absurdity that time is both transitional and conserving is manifested baldly. In our own situation at the University of San Francisco, the real questions as to the university's goals for next year have not been posed. What will be our Occam's razor for decision-making at budget time?

Projections of incomes and expenditures are future-directed variables. These variables of the future are measured partially by anticipated enrollments, the number of student credit hours purchased, and the amount of estimated instructional and support services required. The data and the method for estimating FY 1973-1974 enrollments and student credit hours follows.

Data and Method: Their Assumptions and Meaning:

The management information system of the University of San Francisco is a crude mélange of manual and machine records. Though this source of data has not been gathered in the best professional manner to insure validity and reliability, these records are all we have. They must be used with caution.

The method employed here to arrive at estimates for FY 1973-1974 enrollments and student credit hours was the standard mathematical and statistical procedure called regression analysis. In simplest terms, this algorithm used the natural historical data (e.g., student enroll-

ments/term and student credit hours/term) to calculate a trend line equation. The trend line equation was then used to extrapolate the estimated value of the desired variable for the next desired period of time. Hence there are two variables involved in any one trend line equation, viz., (1) the independent variable of time, designated uniformly by the letter X; (2) the dependent variable (that is, the variable to be estimated for the next time period) which was either enrollments or student credit hours, designated uniformly by the letter Y. On the accompanying graphs, the X axis or time dimension is always the horizontal axis; and the Y axis or the variable to be estimated for the next time period is always the vertical axis. In the charts and trend line graphs that detail this report all variables and measurements are clearly labeled.

The formal character of the regression algorithm is quite indiffer-ent to the ontic character of the data, though the measurements need be interval or ratio scales. But more important is the meaning that is to be attached to the trend line equation generated through the natural historical data of the university and the extrapolated value of the estimated variable for the next period of time. That meaning rests in the important assumption that lies behind the use of regression analysis. That assumption is aptly capsuled in the Shakespearean line "What's past is prologue." Being mathematically built upon a particular empirical time series, the trend line equation contains empirically within it the capsuled experience for given time intervals. The user of the equation must assume the continuance of those conditions which generated that particular set of empirical data so formally capsuled in the trend line

equation. But here is the rub! One does not know whether the same conditions will obtain in the future. Also the use of the field personnel who are closest to the scene comes to the fore; their experience and direct involvement can provide some useful clues. Unlike the apparent "law-like" or "rule-like" character of natural phenomena that seem to have fewer degrees of freedom under laboratory conditions, human behavior (individual or collective) manifests infinite degrees of freedom. Therefore, human behavior exhibits a greater degree of contingency about future behavior of particular persons and groups than do natural phenomena. Short of occult methods, the use of historical and natural trend data for projective purposes is reasonable and about the only systematic processes for objectively estimating future values on given variables. In an analogical sense, we are following Wordsworth dictum "Let Nature be your teacher," when we use the natural history of the university as our teacher for the future.

The reader probably noted that the term "prediction" has not been used. This is so because it carries a scientific denotation of such "rule-like" precision and accuracy as given by the well known formula for acceleration, viz., $s = .5gt^2$. However the terms "projections" and "estimates" are used throughout this report because they seem to convey better the connotation of contingency and possible error in the estimates provided here for FY 1973-1974 enrollments and student credit hours. The terms "projections" and "estimates" must be read as caveates, or warnings, or admonition to caution, given the shallow validity of the data, the contingency of human behavior in the specific future instance of 1973-1974, and the opacity of the future.

Budgetary Decision-Making and Estimates of the Future:

As noted at the beginning of this report, institutional research provides organizational intelligence to the university for reality-testing and cybernetic reasons. Such organizational intelligence as the FY 1973-1974 estimates on enrollments and student credit hours is provided to the university as an aid in budget construction. The decision-making authority who has responsibility for final budget decisions must be convinced of the reasonableness of the estimates provided by institutional research procedures. That authority must make the decision to accept, reject, or modify the estimates as seems reasonable to him or them. Organizationally, however, the responsibility for actual decisions as to what is included as estimates within the university budget never devolves upon others. Thus all budgetary estimates of income and expenditures found in the final budget document are the sole responsibility of the accountable authority for decisions on the budget. See Appendix A document.

Data Lexicon:

For purposes of clarity of the categories used in this report, the following definitions are given:

(1) Academic Year: The academic year is defined to be the following school terms in the sequence given, viz., summer, fall, intersession, and spring.

(2) Budgeted Instructional Area: A budgeted instructional area refers to a resource allocation and expense center within the

budget's structure that is designated for instructional service and its support. Such a center is not necessarily co-terminal with the school and college structure of the university, e.g., the Graduate Division, the Summer Session, Intersession, and Evening College.

(3) Courses-Graduate and Professional: Graduate and professional courses are those designated in the University Catalogue by numbers in the 200's and 300's.

(4) Courses-Noncredit: Noncredit courses are those university taught courses to which no unit credit value has been assigned.

(5) Courses-Undergraduate: Undergraduate courses are those designated in the University Catalogue by the numbers 001 through 199.

(6) Fiscal Year: The university's fiscal year is defined to begin on July 1 of one year and end on June 30 of the following year. Also, the academic year is co-terminal with the fiscal year, viz., summer, fall, intersession, and spring.

(7) Full Time Student: The full time student is defined as one who is enrolled and pursuing a program of 12 or more semester credit hours.

(8) Part Time Student: The part time student is defined as one who is enrolled and pursuing a program of 11 semester credit hours or less.

These definitions have been uniformly observed and any variance from these by any of the several schools and colleges would account for differences in the data used.

FY 1973-1974 Estimates:

All FY 1973-1974 estimates of enrollments and student credit hours are summarized in two tables. These are Summary Tables Nos. 1 and 2.

There are three columns in these tables. The first column of numbers is that of the regression analysis estimates. The second column, titled "Administrative Adjustments," contains such modifications of the

regression study estimates as experience and belief lead the several deans and directors to express. The last column is left blank, to be filled in with the final decisional judgments on these estimates. One technical note: inasmuch as a total population of variables rather than a sampling was used in these regressions, no confidence limits were calculated.

[Insert Summary Tables Nos. 1 and 2 Here.]

Two Recommendations:

Believing that the university ought to capitalize upon this first extensive experience in formal estimation procedures for the budget, permit me to suggest two recommendations for what they are worth.

(1) The curricular unity and organizational integrity of the university structure should be preserved and should dictate the budget's format for resource allocations and resource expenditures. This could be achieved by budgeting in terms of the seven schools and colleges only, viz., Arts, Business Administration, Education, Evening, Law, Nursing, and Sciences. These schools and colleges need to budget their curricula holistically for the total year, viz., summer, fall, intersession, and spring. Undergraduate and graduate courses should be accounted for within the schools and colleges taught.

(2) All instructional and research units should be organized under the most closely related school and/or college and their budgeting become part of these basic units.

These two recommendations would go a long way toward an holistic curricular reflection within the budget at the school and college level of the university. One must admit that the current year's budgeting fragmentation of the curriculum by separate terms and other historical anomalies was most unfortunate. Ask the deans and directors about their plights.

APPENDIX A

UNIVERSITY OF SAN FRANCISCO

OFFICE OF
INSTITUTIONAL STUDIES

MEMORANDUM NO. 9

To: The Reverend E. J. Smyth, S.J.
Acting President, and
The President's Council

Fr: James Steve Counelis, Director
Office of Institutional Studies *JS*

Date: October 18, 1972

Re: Commentary on Acting President Smyth's working document
"Proposed Procedures for Budget Planning, 1973-1974."

+

Permit me to put in writing a few comments on this excellent working document, for writing helps me to articulate the issues.

It is my position (and I believe the shared understanding of the President's Council) that all estimates of future enrollments in headcounts or credit hours are contingent at best. Given the known unreliability of our current management information (which will hopefully be improved over time), the estimates will be further biased. Nonetheless, a range of estimates will be provided so that a judgment could be rendered within some level of confidence. However, I underscore the point that the final decision for what particular estimates to be used in the budget's projection of instructionally based income rests ultimately with the President, he taking into consideration the commentary and advice received through the President's Council and the university's professional staff. In this regard, I believe the expressed and implied procedures outlined by Fr. Smyth in this memorandum are in accord with the better principles of university administration known today.

There is one other comment that I must make, that is, the absence of a set of "priorities" or "worths" or "utilities" or "values" or "criteria" against which the budgetary process of the university will judge the elements and totality of the finished product, called "University of San Francisco Budget, FY 1973-1974." The absence of these criterial watermarks in this procedural paper will inevitably become the rocks and shoals upon which university's needs, expectations, desires, morale, dignity, and integrity will

be dashed. A university budget is a programmatic blueprint of resource allocations directed to some immediate and more remote goals. The principles of efficiency and effectiveness are empty processes in the absence of articulated priority-arranged programmatic ends.

APPENDIX B

BRIEF TECHNICAL NOTE

In the construction of the regression equations, the FY 1972-1973 Budget estimates were used for 1973 Intersession and Spring terms. If these terms turn out to be highly inflated, hence, the regression estimates will be inflated as well. Thus the utility of the Administrator adjustments is seen here.

CHART NOTES

Note 1:

Dr. Edward J. Griffin, Dean of the School of Education, stated that because of the unnatural division of education courses among the Graduate Division, Summer Session, Intersession, and the School of Education, he wished to note that the estimate of 6,600 units includes undergraduate, graduate, and professional courses (100 - 300 course levels) for the Fall and Spring Semesters only, even though he provides the personnel for all academic terms of the year.

Note 2:

The Reverend John H. Martin, S.J., Dean of the Graduate Division notes that many graduate students take upper division courses as part of their programs, and, indeed there are in the M.A. in education and the M.A.T. programs a goodly number of required upper division courses. Inasmuch as the 1,778 student credit hour estimate was built upon 200 - 300 level courses, Fr. Martin placed 3,625 units in the Administrative Adjustment column to account for all levels of courses taken by graduate students.

Note 3:

The Reverend Andrew C. Boss, S.J., Director of the Labor-Management School indicated that the nature of the enrollment patterns is quite difficult to predict. There are a goodly number of variables over which he has little control. Fr. Boss stated that he could not accept or reject the estimated FY 1973-1974 enrollment at 272 students because for him such a result was without meaning. He also noted that in his file of non-salary budget worksheets are contained several live possibilities of funds and students that would certainly invalidate the estimated 272 students were they to materialize.

APPENDIX C

BRIEF TECHNICAL NOTE

In the reading of the graphs, please note that the vertical scale on all the graphs are not identical. This would have been impossible for the size of sheet, 8 1/2" by 11", upon which these graphs were constructed. However, the time scale, which is the horizontal line, is uniform for all graphs.
